Citation Searching: Google Scholar

So you have an article in your hands, and you want to see where it fits into the scholarly conversation. What works does this author respond to, and who has responded to this author since the study was published.

Citations are the road map to this published conversation, and tracking the citations backward and forward can help put a study into context, and broaden understanding of the research.

Access Google Scholar (scholar.google.com).

Step 1: Search for the article you want to track. Using the last name and a portion of the article title is a good search strategy.

Step 2: Locate your desired article in the results list. Note the "Cited by ##" link in the lower left of your article entry. Click this to see citing articles.
Step 3: When reviewing your results, remember that Google Scholar will find more than just scholarly books and articles. Watch for unpublished papers, conference proceedings, and even PowerPoint presentations in your results.

Use your evaluating skills to decide what's appropriate for your research.
